

ABSTRACT

Geographic coordinates of user equipment of a paged party are determined either by communicating with a GPS receiver associated with the user equipment of the paged party or by cellular triangulation. The geographic coordinates may be
5 converted into an associated common location description. For example the common location description is a city name, an address, or a distance and direction from a landmark. The geographic coordinates, common location description, or an abbreviation thereof, is transmitted to user equipment of a paging party. Using this service, parents may verify the location of their children. Security agencies or
10 delivery services may verify and/or log the location of their personnel.
